

400 mA, 38 V low-dropout regulator, with 45 μ A quiescent current

Features

- AEC-Q100 qualified 
- Low quiescent current: typ. 45 μ A at no load
- Wide input voltage operating range up to 38 V
- Low startup voltage: 3.5 V
- Output current up to 400 mA
- Output voltage options: Adj from 2.5 V and fixed, 3.0, 3.3, 5.0 and 8.5 V
- Output voltage accuracy:
 - $\pm 1\%$ typ. @ 25 $^{\circ}$ C
 - $\pm 3\%$ (including line, load and temperature variation)
- Ultra low-dropout:
 - 36 mV @ 100 mA load current
 - 140 mV @ 400 mA load current
- High PSRR: 70 dB @ 1 kHz
- Very low noise: 20 μ V_{RMS}/V_{OUT}
- Protection features: current limitation, thermal shutdown
- -40 $^{\circ}$ C to +125 $^{\circ}$ C operating temperature range
- Package: DFN6 (3x3) (wetable flanks)

Maturity status link

[LDO40L](#)

Applications

- Automotive applications
- Body control modules
- Instruments and clusters
- Automotive LED lighting

Description

The **LDO40L** is a 400 mA LDO regulator, designed for being used in severe automotive environments.

Low quiescent current makes it suitable for applications permanently connected to battery. This feature is especially critical when electronic modules remain in active mode when ignition is off.

The **LDO40L** embeds protection functions, such as: current limit and thermal shutdown.

The extended input voltage range, low drop voltage and low quiescent current features make it suitable also for low power industrial and consumer applications.

1 Block diagram

Figure 1. Block diagram, fixed version

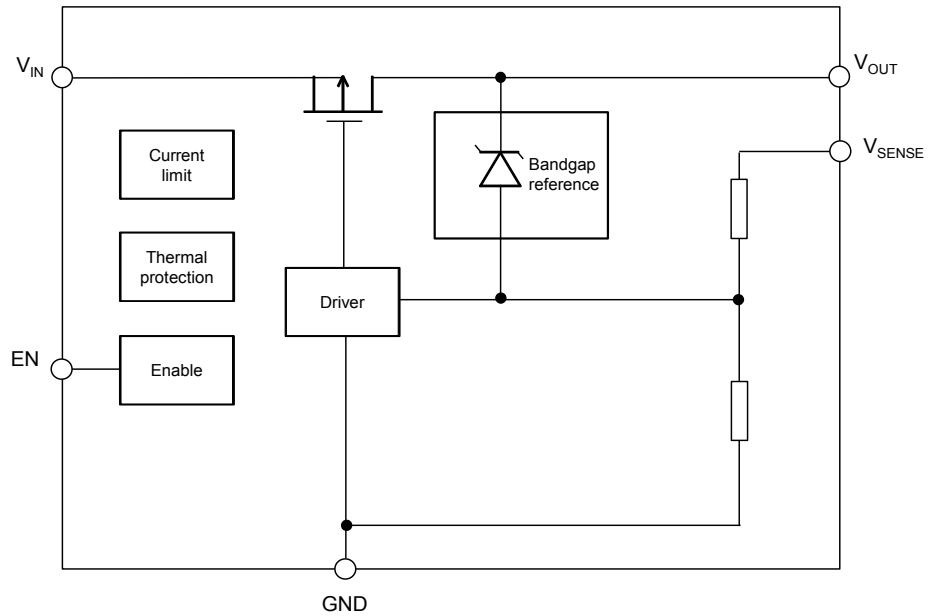

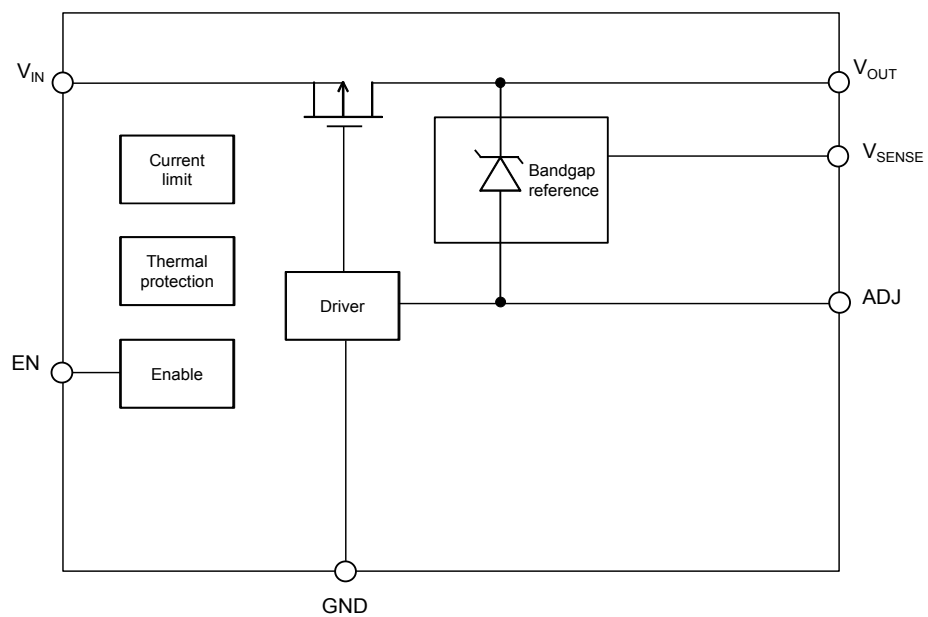

Figure 2. Block diagram, adjustable version

2 Pin configuration

Figure 3. Pin configuration (marking view)

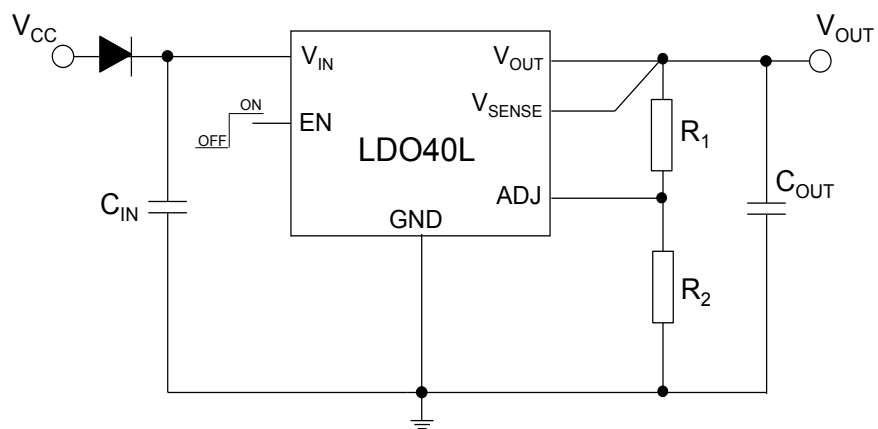

Table 1. Pin description

Symbol	Pin n°	Description
V_{IN}	3	LDO supply voltage
GND	1	Ground
V_{OUT}	4	LDO output voltage
EN	2	Enable input: set V_{EN} = high to turn on the device V_{EN} = low to turn off the device Don't leave this pin floating
V_{SENSE}	5	Output sensing pin. It must be connected to V_{OUT}
ADJ / NC	6	Adjust pin. Connect a resistor divider to set the output voltage This pin is not internally connected in the fixed version
TAB / Exposed pad	Exposed pad	It must be connected to GND

Figure 5. Typical application diagram (adjustable versions)

4 Absolute maximum ratings

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{IN}	Input supply voltage	-0.3 to 40	V
V_{OUT}, V_{SENSE}	Output voltage	-0.3 to 12	V
V_{ADJ}	Adjust pin voltage	-0.3 to V_{OUT}	V
V_{EN}	Enable pin voltage	-0.3 to V_{IN}	V
I_{OUT}	Output current	Internally limited	A
P_D	Power dissipation	Internally limited	W
ESD	Charge device model	± 500	V
	Human body model	± 2000	
T_J	Operating junction temperature range	-40 to 150	$^{\circ}\text{C}$
T_{STG}	Storage temperature	-65 to 150	$^{\circ}\text{C}$

Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. All values are referred to GND.

Table 3. Thermal data

Symbol	Parameter	DFN6	Unit
R_{thJA}	Thermal resistance, junction-to-ambient	42	$^{\circ}\text{C}/\text{W}$
R_{thJC}	Thermal resistance, junction-to-case	5	$^{\circ}\text{C}/\text{W}$

Note: R_{thJA} for DFN6 based on a 4-layer JEDEC PCB (2S2P) test board with 2 thermal vias.

5 Electrical characteristics

Unless otherwise specified: $T_J = -40$ to 125 °C; $V_{IN} = 13.2$ V, $V_{OUT} = 5$ V, $V_{EN} = 5$ V, $I_{OUT} = 1$ mA;
 $C_{IN} = C_{OUT} = 1$ μ F; Typical values referred to $T_A = 25$ °C.

Table 4. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{IN}	Operating input voltage range (see Section 6.1 Operating input voltage)	Device On	3.5		38	V
		Minimum input voltage for regulation ⁽¹⁾	$V_{OUT} + V_{DROP}$		38	V
V_{OUT}	Operating output voltage range		2.5		11	V
V_{OUT}	Output voltage accuracy (fixed version)	$V_{OUT} + 1$ V ⁽²⁾ < $V_{IN} < 18$ V, 0.1 mA < $I_{OUT} < 400$ mA, -40 °C < $T_J < 125$ °C	-3		3	%
		$T_J = 25$ °C	-1		1	
V_{REF}	Reference voltage (adjustable version) ($V_{OUT} - V_{ADJ}$)	$V_{OUT} + 1$ V ⁽²⁾ < $V_{IN} < 18$ V, 0.1 mA < $I_{OUT} < 400$ mA, -40 °C < $T_J < 125$ °C	1.164	1.2	1.236	V
		$T_J = 25$ °C	1.188		1.212	
$\frac{\Delta V_{OUT}}{\Delta V_{IN}}$	Static line regulation	$V_{OUT} + 1$ V ⁽²⁾ < $V_{IN} < 18$ V; $I_{OUT} = 1$ mA		0.002	0.02	%/V
$\frac{\Delta V_{OUT}}{\Delta I_{OUT}}$	Static load regulation	0.1 mA < $I_{OUT} < 400$ mA		0.0001	0.002	%/mA
V_{DROP}	Dropout voltage ⁽³⁾	$I_{OUT} = 0.1$ A; $V_{OUT} = 5$ V		36	70	mV
		$I_{OUT} = 0.4$ A; $V_{OUT} = 5$ V		140	270	
eN	Output noise voltage	f = 10 Hz to 100 kHz; $I_{OUT} = 10$ mA		20		μ V _{RMS} / V_{OUT}
SVR	Supply voltage rejection	$V_{OUT} = 5$ V, f = 100 Hz; $I_{OUT} = 10$ mA		77		dB
		$V_{OUT} = 5$ V, f = 1 kHz; $I_{OUT} = 10$ mA		70		
		$V_{OUT} = 5$ V, f = 10 kHz; $I_{OUT} = 10$ mA		45		
		$V_{OUT} = 11$ V, f = 100 Hz; $I_{OUT} = 10$ mA		77		
		$V_{OUT} = 11$ V, f = 1 kHz; $I_{OUT} = 10$ mA		68		
		$V_{OUT} = 11$ V, f = 10 kHz; $I_{OUT} = 10$ mA		42		
I_Q	Quiescent current	$I_{OUT} = 0$ to 1 mA		45	90	μ A

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I _Q	Quiescent current	I _{OUT} = 400 mA		80	140	μA
	Shutdown current	V _{EN} = 0 V, V _{IN} = 13.2 V		0.2	2.2	μA
I _{ADJ}	Adjustable input current				1	μA
I _{SC}	Short-circuit current	V _{IN} = 6 V, V _{OUT} = 0 V	1.2	1.6		A
V _{EN}	Enable input logic low, V _{EN-L}				0.65	V
	Enable input logic high, V _{EN-H}		2.7			
I _{EN}	Enable pin input current	V _{IN} = 6 V, V _{EN} = 5 V		0.5	1.5	μA
T _{SHDN}	Thermal shutdown			175		°C
	Hysteresis			25		

1. $V_{IN-MIN} = V_{OUT} + V_{DROP}$ or 5 V, whichever is greater.
2. $V_{IN} = V_{OUT} + 1$ V or 5 V, whichever is greater.
3. Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value.

6 Application information

6.1 Operating input voltage

The LDO40L is a low-dropout linear voltage regulator equipped with a low- $R_{DS(on)}$ P-channel MOSFET used as a pass-element. The device internal circuits are able to start with an input voltage as low as 3.5 V, whatever is the nominal output voltage (see [Figure 22. Output voltage vs. input voltage \(no load\)](#)). Defined the desired output voltage $V_{OUT-NOM}$, the minimum input voltage V_{IN-MIN} needed to fully bias the pass-element, is

$V_{IN-MIN} = V_{OUT-NOM} + V_{DROP}$. This allows to exit the dropout condition and achieve output voltage regulation.

The full regulation performance guaranteed by [Section 5 Electrical characteristics](#) in terms of output accuracy and tolerance versus line and load changes is achieved for the highest input voltage among $V_{IN-MIN} = V_{OUT-NOM} + 1\text{ V}$ and $V_{IN-MIN} = 5\text{ V}$.

At input voltages lower than $V_{IN-MIN} = (V_{OUT-NOM} + V_{DROP})$ the regulator enters dropout condition, regulation is not guaranteed and the output voltage tracks the input except for a voltage depending on the load current (I_{OUT}) and the pass-element resistance (see [Figure 22. Output voltage vs. input voltage \(no load\)](#)). This tracking behavior can be useful during cold crank conditions.

6.2 Output voltage adjustment

The LDO40LY is available in fixed and adjustable output voltage versions. The latter option is usually chosen when the output voltage has to be set to non-standard values. In the adjustable version, the output voltage can be set from 2.5 V up to 11 V, by connecting a resistor divider between the ADJ pin and the output.

The architecture of the LDO40LY features a precise bandgap reference, which generates a fixed voltage $V_{REF} = 1.2\text{ V}$ between V_{OUT} and ADJ terminals (refer to [Figure 2. Block diagram, adjustable version](#) and [Figure 5. Typical application diagram \(adjustable versions\)](#)). When the R1-R2 resistor divider is connected, a fixed current is generated through the divider. Since the contribution of current sourced by the ADJ pin is negligible (few tens of nA), the resulting output voltage is obtained by using the following equation:

$$V_{OUT} = V_{REF}(1 + R2/R1), \text{ with } V_{REF} = 1.2V(\text{typ.}) \quad (1)$$

In order to guarantee a correct regulation, the resistor divider must be calculated for an output voltage of min. 2.5 V.

6.3 Output voltage sense pin

In the DFN6 package on pin 5, an additional V_{SENSE} connection is available. This pin must not be left floating, since it is necessary for a correct sensing of the output voltage. It can be either connected to the load in a remote-sensing configuration, or directly shorted to the V_{OUT} pin (pin 4, refer to [Figure 4. Typical application diagram \(fixed versions\)](#) and [Figure 5. Typical application diagram \(adjustable versions\)](#)).

6.4 Protection features

The device is self-protected from short-circuits and overtemperature events.

In case of strong overload or short-circuit on the output, the output current is limited to a value of typically 1.5 A and kept constant even when the load impedance is zero. If the overload persists, the temperature on the internal die rises, until the thermal protection is triggered, which happens when the junction temperature reaches 175 °C. The device is subsequently shut down. As soon as the junction temperature falls again below 150 °C the device re-starts.

Even if the above described protections are able to keep the device safe in the worst cases, a correct thermal design of the application is recommended, according to the operating ambient temperature and the maximum power dissipation allowed by the chosen package. In order to calculate the maximum power that the device can dissipate, keeping the junction temperature below $T_{J-OP} = 125\text{ °C}$, the following formula is used:

$$P_{DMAX} = (125 - T_{AMB}) / R_{THJ} - A \quad (2)$$

The power dissipation on the device is calculated as $P_D = (V_{IN} - V_{OUT}) \times I_{OUT}$.

6.5 Enable pin

The enable function allows the LDO output to be enabled/disabled. The regulator is turned on in case the pin EN is connected to a voltage higher than V_{EN-H} , the LDO can be turned off if the voltage on EN pin is lower than V_{EN-L} .

No internal pull-up / pull-down is present on the EN pin, therefore it must not be left floating in the application.

6.6 Input and output capacitors

The LDO40LY requires external capacitors to ensure the regulator control loop stability.

A capacitor with a minimum value of 1 μF is required on at the input port of the LDO40LY.

This capacitor must be located as close as possible to the input pin of the device and returned to a clean analog ground. Good quality ceramic capacitors are suggested.

The device control loop is designed to be stable with good quality ceramic capacitors (such as: X5R/X7R types) with a minimum capacitance of 1 μF and equivalent series resistance in the [5 m Ω – 12 Ω] range. There is no upper limit to the output capacitance. [Figure 27. Stability plan](#) shows the stability plan tested on real capacitors, up to 10 μF . A value of 4.7 μF is suitable for the majority of applications, improving dynamic response and minimizing the risk of ringing and oscillations. It is important to highlight that the output capacitor must maintain its capacitance and ESR in the stable region over the full operating temperature, load and input voltage ranges, to assure stability. Therefore, capacitance and ESR variations must be taken into account in the design phase to ensure the device works in the expected stability region. There is no maximum limit to the output capacitance, provided that the above conditions are respected.

7 Typical characteristics

The following plots are referred to the typical application circuit with $C_{IN} = C_{OUT} = 1 \mu\text{F}$ and $T_A = 25^\circ\text{C}$ unless otherwise noted.
